Profile Page

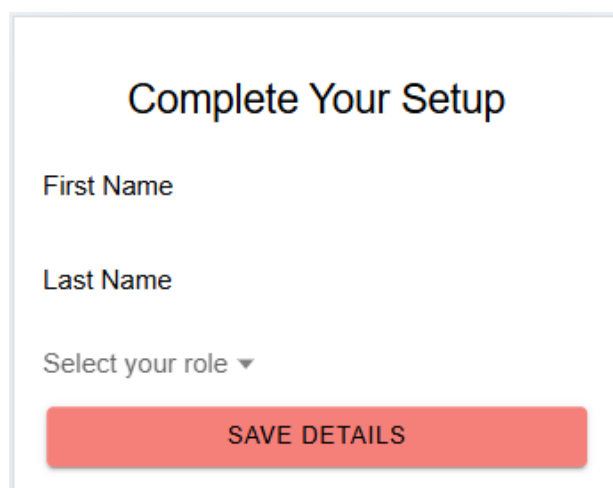

- This page contains details about the recipe creator, including their recipes.
- Clicking on a specific recipe will take you to the **Recipe Page**.
- This page is still a draft.

The screenshot shows a mobile app interface for a profile page. At the top, there is a navigation bar with a back arrow, the text 'profile', and a 'PRIVATE ZONE' button. Below the navigation bar, the main content area is titled 'User Profile'. It contains three input fields: 'First Name: shahar', 'Last Name: babkoff', and 'Role: User'. Each field has a horizontal line below it for additional input.

Setup Page

- Users will fill in additional profile details on this page.

The screenshot shows a mobile app interface for a setup page. The title 'Complete Your Setup' is centered at the top. Below the title, there are three input fields: 'First Name', 'Last Name', and 'Select your role' with a dropdown arrow. At the bottom, there is a red button labeled 'SAVE DETAILS'.

Private Zone Page

- Clicking the "Settings" button will navigate you to the **Settings Page**.
- Clicking the "Saved Recipes" button will navigate you to the **Saved Recipes Page**.
- If you are a recipe creator, you will also have a "Create Recipe" button. Clicking this button will navigate you to the **Create Recipe Page**.

Settings Page

- Clicking the "Logout" button will navigate you to the **Login Page**.

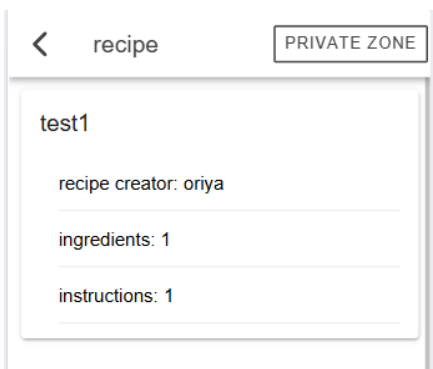

The screenshot shows a mobile app interface for the 'settings' page. At the top, there is a back arrow and the title 'settings', followed by a 'PRIVATE ZONE' label. The main content area is divided into two sections. The first section is titled 'Change Your Password' and contains two input fields labeled 'Current password' and 'New password'. Below these fields is a red button labeled 'CHANGE PASSWORD'. The second section is a separate box at the bottom containing a red button labeled 'LOGOUT'.

Saved Recipes Page

- This page will display a list of all the recipes saved by the user.
- Clicking on a recipe will navigate you to the **Recipe Page**.
- This page is still under development.

Recipe Page

- This page will display the details of a recipe.
- A rating feature will also be added to allow users to rate the recipe.
- This page is still under development.

The screenshot shows a mobile app interface for the 'recipe' page. At the top, there is a back arrow and the title 'recipe', followed by a 'PRIVATE ZONE' label. The main content area displays the title 'test1' in a bold font. Below the title, there are three sections: 'recipe creator: oriya', 'ingredients: 1', and 'instructions: 1'. Each section has a horizontal line below it, suggesting a list or detailed view.

Create Recipe Page

- This page allows recipe creators to add and publish new recipes.
- This page is still under development.

This project uses the MVVM (Model-View-ViewModel) architecture. Here's an explanation of each component in the context of this project:

Model - Represents the data.

In this project, the Model is represented by Firebase Firestore and Firebase Authentication, which handle data storage and user authentication.

View - Represents the UI components that display data to the user.

In this project, the View is represented by the React components and Ionic UI components that render the user interface.

ViewModel - Acts as an intermediary between the Model and the View.

In this project, the ViewModel is represented by the React hooks and state management logic that handle data fetching, state updates, and user interactions.

Why MVVM Architecture:

Maintainability:

Clear separation of concerns makes the codebase easier to understand and maintain. Isolated logic in the ViewModel simplifies debugging and testing.

Reusability:

The ViewModel can be reused across different Views. For example, if you have multiple components that need to display user data, they can share the same ViewModel.

Scalability:

As the application grows, the MVVM architecture makes it easier to manage complexity. New features can be added by creating new ViewModels and Views without affecting existing functionality.

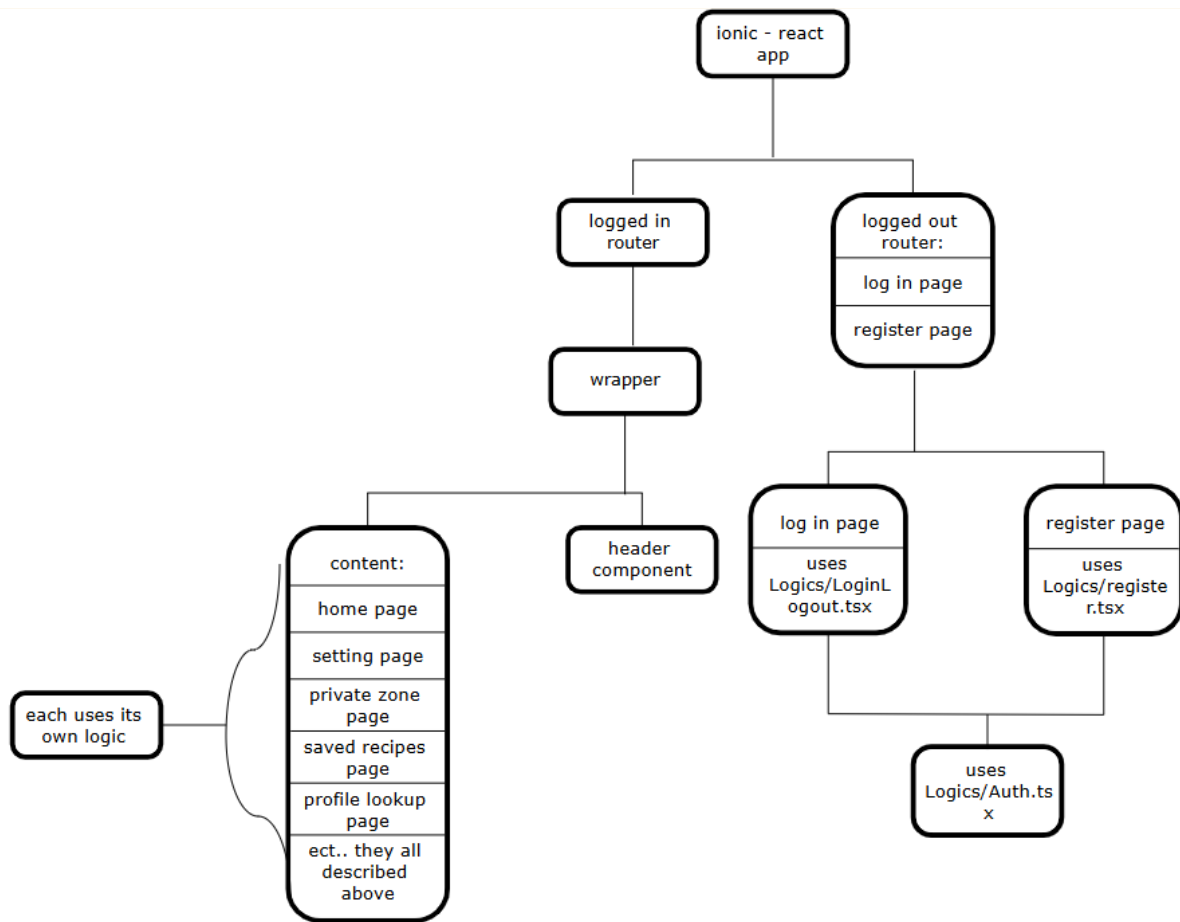

State Management:

In a React application, the ViewModel can be implemented using hooks and state management libraries (e.g., Redux, Context API). This aligns well with React's component-based architecture and makes it easier to manage application state.

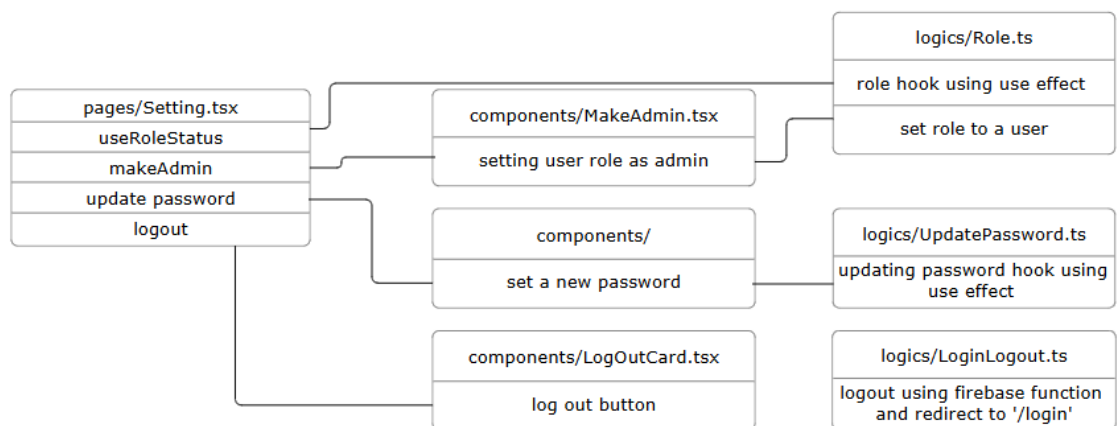

Performance:

Efficient state management and data binding ensure that the UI is always in sync with the underlying data, providing a responsive user experience. Asynchronous operations handled in the ViewModel prevent UI blocking, enhancing performance.
